TITLE: Electron transfer in nitroso-compound reactions. I. Mechanism of tri-
 fluoronitrosomethane disproportionation

SOURCE: Zhurnal obshchey khimii, v. 35, no. 8, 1965, 1418-1422

TOPIC TAGS: electron transition, reaction mechanism, EPR spectrum, organic nitroso
 compound, aliphatic fluoronitro compound, methane

ABSTRACT: The mechanism of trifluoronitrosomethane disproportionation was studied
 in various organic and aqueous alkaline solvents in the temperature range from
 -120° to 20°C. A detailed examination of the EPR spectra indicated that in the ab-
 sence of a reducing agent, the first stage of trifluoronitrosomethane dispropor-
 tionation in an aqueous alkaline solution [CF₃NO + (C₂H₅O) + 20% aqueous NaOH] is as
 follows

Card 1/3

L 00892-66

ACCESSION NR: AP5020084

In the next stage,

hexafluoroazoxymethane and trifluoronitromethane are formed in a reaction proceeding via the ion-radical mechanism. In the range from -120° to room temperature, the EPR spectra indicate formation of a paramagnetic species at the interphase. Examination of the structure of the EPR spectra at -120°C indicates formation of several types of free radicals. The hydroxy radicals, doublet with identical intensity and a splitting of $\Delta H = 58 \text{ Oe}$, recombine at -100°C . At 20°C the ratio of intensities of the 6 hyperfine lines is close to 1:4:7:7:4:1 which corresponds to a radical incorporating a group CF_3N . Similarly, 6 hyperfine EPR lines but with-

out doublet splitting were found using ethyl ether, chloroform, methyl chloride, and ethyl chloride as solvents. In the $\text{CF}_3\text{NO} + \text{C}_2\text{H}_5\text{OH}$ system the doublet splitting

Card 2/3

L 00892-66

ACCESSION NR: AP5020084

(ΔH) is equal to 3.3 Oe which is about 1.5 times greater than that found in the systems involving either toluene or hexane. No EPR spectrum corresponding to trifluoronitrosomethane was found using either carbon tetrachloride or trifluoroacetic acid as solvents. The transformation of trifluoronitrosomethane into the dimetric ion-radical (IV) in the absence of a reducing agent involves formation of a π -complex intermediate and proceeds according to the following mechanism

 Title : The Stabilizing Effect of Milk on Vitamin C.
 Orig Pub : Prumysl. potraviny, 1956, Vol 7, No 6, 269-271

Abstract : The effect of various amounts of milk and whey on the stability of l-ascorbic acid solutions in distilled and in drinking water during the preparation of various foods has been investigated. It has been established that the addition of 10-20% of milk or of whey results in a marked decrease in the loss of ascorbic acid. The vitamin C stabilising effect of milk has been demonstrated in many sauces rich in vitamin C. The author outlines the basic principles of the application of milk as a vitamin C stabiliser in the food processing industry.

1638. L-ASCORBIC ACID AND PROTEIN METABOLISM. V. CHANGES IN THE SERUM PROTEIN FRACTIONS AT DIFFERENT STAGES OF C-AVITAMINOSIS IN GUINEA-PIGS (Czech text) - Ginter E. Inst. Nutrit., Bratislava - PHYSIOL. ROHEM, 1958, 7/3 (234-240) Tables 1

During the first week after omitting L-ascorbic acid from the diet, a significant decrease occurred in the albumins, with an increase in the α -globulin fractions. This decrease and increase also persisted in the further phases of C-avitaminosis until death. The β - and γ -globulins were not affected during the first 2 weeks of C-avitaminosis. The next week (from the 21st day), when the experimental animals began to lose weight, a permanent increase occurred in the β -globulins, with a temporary increase in the γ -globulins, which returned to normal shortly before the death of the scorbutic animals.

2776. L-ASCORBIC ACID AND PROTEIN METABOLISM. VI. FREE AMINO ACIDS IN SOME GUINEA-PIG TISSUES IN EXPERIMENTAL SCURVY (Russian text) - Ginter E. Inst. of Human Nutrit., Physiol. Dept., Bratislava - PHYSIOL. BOHEM. 1958, 7/4 (409-414) Tables 3

In the liver, C avitaminosis resulted in a marked fall in the glutathione level, an increase in glutamic acid and a decrease in the glutamine level. In the spleen of scorbutic guinea-pigs a marked increase occurred in the amount of free alanine and a decrease in the level of free glutamine. A slightly significant tendency to a decrease of free glycine was observed. The spectrum of free amino-acids in the brain was not affected by C avitaminosis.

Title : L-Ascorbic Acid and Protein Metabolism. II. Nitrous
Balance in Guinea Pigs in the Early Stage of Avitami-
sis.

Orig Pub : Biologia, 1958, 13, No 1, 45-52

Abstract : In growing guinea pigs which received scorbutigenic ra-
tions, in the first 7 days after termination of L-ascor-
bic acid (I) administration, the excretion of N with
urine considerably increased, as a consequences of which
the positive nitrous balance decreased. The weight in-
crease of guinea pigs on the first day of their depriva-
tion of I was considerably lower than in guinea pigs
which received the same scorbutigenic ration but with

daily addition of 3 mg of I per animal. The consumption
of N in animals of both groups was the same. The increa-
se of N excretion with urine, connected with a decrease
of weight increase, in one of the first symptoms of C
insufficiency in rations. It is assumed that I plays
an essential role in protein metabolism, and that insuf-
ficiency of vitamin C in the feed in the course of sever-
al days induces in guinea pigs a disturbance of the
equilibrium of synthesis and protein decomposition proces-
ses to the side of the prevalence of the latter with the
latter predominating.

TITLE: Influence of high-fat high-cholesterol diet upon the metabolism of lipids in rats.

SOURCE: Biologia, no. 7, 1965, 537-545

TOPIC TAGS: rat, biologic metabolism, nutriology, biochemistry

ABSTRACT: [Authors' summary modified]: Long-term diets containing high amounts of cholesterol and triglycerides cause an accumulation of cholesterol in the liver, adrenal glands, epididymal fatty tissue, and blood of rats. At the same time, the concentration of beta-lipoproteins increases. Biosynthesis of cholesterol in liver and the adrenal glands was decreased drastically; the levels of esterified fatty acids and lipid phosphorus in blood and tissues did not change significantly. Although there was a deep upset of the fat metabolism, deposition of lipids in the aorta was not found. The authors conclude that it is very difficult to provoke the syndrome of arteriosclerotic changes in rats.

"Acclimatization to Cold and Lipid Metabolism."

Prague, Casopis Lekarů Ceských, Vol 105, No 38, 16 Sep 66, pp
1022 - 1029

Abstract: The influence of low temperatures on the metabolism of lipids is discussed. Basic principles of thermoregulation, the reactions of the organism to the reduced temperature of the surroundings, acclimatization phenomena and their mechanism, and the metabolism of lipids under the conditions of acclimatization to cold are described. Authors' experiments with rats exposed to intermittent long periods of exposure to cold are discussed. A normalization effect of cold acclimatization on the level of liver glycogen is described. Histological changes of the myocardium in rats exposed to cold and fed an atherogenic diet are discussed. 4 Figures, 76 Western, 2 Czech references. (Manuscript received Dec 64).

ABSTRACT: The advantages of service stations for plant protection over state machine centers are discussed. The successful operation of service stations in the Poznan province is cited and the conclusion is drawn that they are preferable to state machine centers. The issue of service stations vs. state machine stations has been discussed in many articles, and therefore, the editor of the periodical "Ochrona roslin" states that the subject has been sufficiently aired and the time for a decision has arrived.

TITLE: Some problems in the improvement of plant protection

SOURCE: Ochrona roslin, no. 7, 1965, 4-6

TOPIC TAGS: plant protection, pest control, plant disease control, plant protection organization

ABSTRACT: The control of plant diseases and pests is discussed in administrative and organizational terms. It is emphasized that the dissemination and achievement of plant protection measures cannot be carried out by the farmers themselves; they must be guided by a strong, homogeneous, and professionally qualified body of administrators, which thus far has not been properly organized in Poland. An important factor accounting for the lack of progress in the modernization of plant protection seems to be the concept of the agronomist as the link responsible for the organization of plant protection on rural territory, despite the fact that he is not a member of the plant protection staff and has no opportunity to become one. It is recommended that the regional-instructor setup be reinstated, and that the agronomist serve only in an auxiliary capacity. Recommendations are given concerning the means of raising the

TITLE: Plant protection service

SOURCE: Ochrona roslin, no. 9, 1965, 3-7

TOPIC TAGS: agricultural machinery, agronomy

ABSTRACT: The advantages of service stations for plant protection over state machine centers are discussed. The successful operation of service stations in the Poznan province is cited and the conclusion is drawn that they are preferable to state machine centers. The issue of service stations vs. state machine stations has been discussed in many articles, and therefore, the editor of the periodical "Ochrona roslin" states that the subject has been sufficiently aired and the time for a decision has arrived.

TITLE: Influence of selection upon the agglutination of baker's yeast

SOURCE: Biologia, no. 3, 1965, 181-184

TOPIC TAGS: yeast, heredity, food technology

ABSTRACT: The heredity of the property of agglutination of baker's yeast was verified by making fourfold selection in commercial yeast and investigating the products. When the selection was made, so that an increased tendency to agglutination would be maintained, the occurrence of agglutinating isolates was increased from 10.4% to 42.9%, and the non-agglutinating isolates fell from 48.7% to 19.5%. In selection favoring non-agglutinated isolates their content increased from 48.7% to 55.4%, and the content of the agglutinated isolates decreased from 10.4 to 3.1%. Orig. art. has: 3 figures. ABSTRACT: Commercial yeast of the Trenčin factory (*S. cerevisiae*) was studied in anaerobic conditions; use of oxygen and production of carbon dioxide were investigated. The same was followed under aerobic conditions. Glucose, sucrose, and maltose were used as substrates. Differences between suspended yeast and yeast that was agglutinated during yeast production were compared. No differences were found in working with glucose and sucrose. In maltose, in a stream of H_2 higher production of CO_2 was shown by agglutinated yeast. Orig. art. has: 3 tables. [JPRS]

TITLE: Determination of certain ruby laser characteristics in the nonstationary generation mode

SOURCE: Zhurnal prikladnoy spektroskopii, v. 2, no. 2, 1965, 142-146

TOPIC TAGS: ruby laser, nonstationary laser operation, pump power dependence, laser pulsation, laser

ABSTRACT: The authors measured the pump waveform, the time of appearance of the first oscillation spike, and the average period of the random laser power pulsations of a 6.5-cm ruby laser with end surfaces having ~90% reflection, and established the dependence of the time of appearance of generation and of the pulsation frequency on the pump power. The results were compared with theoretical calculations of the average pulsation power based on the determination of the absolute probability of pump-quantum absorption, developed in earlier papers of one of the authors (Samson, Opt. i spektr. v. 16, 869, 1964, and others). The experimental

Card 1/2

L 43194-65
ACCESSION NR: AP5010043

results have confirmed the validity of the theory, which is shown to apply also to irregular pulsations. The minimum energy introduced into the active medium is estimated. It is pointed out that the results can yield, in principle, new data on the characteristics of the working medium in the lasing mode by measuring the nonstationary behavior of the laser as the interferometer base is varied. TITLE: Nonstationary generation of a laser with ground ruby 15

SOURCE: Zhurnal prikladnoy spektroskopii, v. 5, no. 3, 1966, 302-305

TOPIC TAGS: solid state laser, ruby laser, laser energy, laser pump

ABSTRACT: The purpose of the investigation was to determine the time behavior of a laser with ground ruby as a function of the distance between the interferometer mirrors and the pump energy, and to check on methods proposed in earlier papers (ZhPS, v. 2, 142, 1965 and v. 3, 128, 1965) for determining certain characteristics of lasers operating in the nonstationary generation mode. The experiment was made with a ruby rod 79.6 mm long and 6.5 mm in diameter at room temperature. The pump was a straight xenon flash lamp with a cylindrical reflector. Before grinding the ruby, the dependence of the threshold pump energy on the interferometer base L was determined, after which the ruby surface was ground. The interferometer base was varied from 20 to 420 cm, and the ruby was symmetrically placed relative to the mirrors. The results show that the dependence of the threshold pump energy on L is the same for ground and transparent ruby rods, and is linear in the distance between the mirrors, but a larger pump energy is needed to excite the ground ruby. The time needed to produce population inversion decreases with increasing pump energy and increases with increasing

Card 1/2

UDC: 535.89

L 04563-67

ACC NR: AF6032443

distance between interferometer mirrors, the latter being connected with the increase in the loss factor. The pulsation time (average distance between spikes at the start of lasing) decreases with increasing pump energy and increases with increasing distance between mirrors, but by a smaller amount than for non-ground ruby rods. Slight deviations are observed in all the measured quantities from their theoretical values, and the reasons for the discrepancies are briefly discussed. Orig. art. has: 3 figures and 2 tables.

AUTHOR: Gintoft, R. I.; ⁴⁴Samson, A. M.; ⁴⁴Sarzhhevskiy, A. M. ⁵⁹_B

TITLE: Dependence of certain ruby laser characteristics on the distance between
 the interferometer mirrors ²⁵₁₅ ^{25,44}

SOURCE: Zhurnal prikladnoy spektroskopii, v. 3, no. 2, 1965, 128-133

TOPIC TAGS: ruby laser, laser pulsation, laser pumping, laser emission, laser
 theory, laser optics

ABSTRACT: This is a continuation of an earlier work by the authors (ZhPS v. 2, 142, 1965) devoted to a study of the dependence of buildup time (time for appearance of first spike) and pulsation period (average time between all spikes) of a ruby laser on the pump energy. The study was made for the case when the reflecting coatings were deposited on the ends of the ruby rod. The present investigation concerns a laser with external mirrors, with a rod 6.5 mm in diameter and 81 mm long. The distance between the interferometer mirrors could be varied from 15 to 360 cm. The buildup time and the pulsation period were measured at different pump powers. The results show that at constant power both the buildup time and the pulsation period increase with increasing distance between mirrors. The threshold pump energy likewise in-

Card 1/2

L 2687-66

ACCESSION NR: AP5021488

creases with the distance. The increase in the buildup time is attributed to an increase in the loss coefficient of the ruby. A comparison of the experimental results with the theoretical calculation confirms this assumption. It is also concluded that the results agree well with the probability-method equations derived earlier by one of the authors (Samson, Opt. i spektr. v. 16, 869, 1964 and later papers), especially with respect to the nonstationary laser emission, and that the study of the nonstationary emission makes it possible to investigate the properties of the laser, the active medium, and the pump conditions. TITLE: The dependence of the energy yield and generation period of a ruby laser on the pumping energy

SOURCE: AN BSSR. Doklady, v. 9, no. 9, 1965, 578-580

TOPIC TAGS: laser, ruby laser, laser output, energy yield, laser pumping

ABSTRACT: The energy yield and generation period of a ruby laser, which normally increase with the pumping energy in the case of interferometers in which the distance L between mirrors is small, were studied for the case of large L's. The laser consisted of a polished ruby rod 8.1 cm long and 0.65 cm in diameter and plane external mirrors with a 97% reflection coefficient in which L was varied from 120 to 420 cm in 1-m steps. The oscillograms of the laser pulses were photographed for each L as a function of the supply voltage of the pump source (a 100- μ f condenser bank). The maximum pump energy was 1000 j. The experimental results indicate that both generation period and energy yield first increase up to a certain maximum which corresponds to a given pumping energy (~ 500 j) and subsequently decrease when the latter is increased. The dependence of the ruby laser generation on temperature, and the possibility of the existence of two threshold values of

Card 1/2

L 2978-66

2

ACCESSION NR: AP5024147

pumping energy, postulated theoretically by D. N. Vylegzhanin and M. Kh. Zelikman (Voprosy radioelektroniki, ser. 12, no. 24, 3, 1964), were not observed experimentally. However, the dependence of the energy yield and generation period of a ruby laser on temperature can be attributed hypothetically to the fact that pumping throughout a crystal, with its internal stresses and inhomogeneities, is distributed uniformly and the ends act as lenses. In the case of polished crystals, the lenses are positive and their focal lengths f vary with pumping. The higher the pumping energy, the shorter the f and the higher the losses and, consequently, the lower the energy yield and generation period. The above hypothesis requires additional experimental confirmation. Orig. art. has: 2 figures. [YK]

TITLE: The influence of the adjustment of the ruby on the magnitude of the threshold pumping energy of a laser

SOURCE: Zhurnal prikladnoy spektroskopii, v. 5, no. 2, 1966, 259-260

TOPIC TAGS: ruby laser, laser energy, laser pumping

ABSTRACT: Two adjustment methods were studied. In the first, the so-called "three crosses" method, an AKT-400 autocollimator is used to superpose, in succession, the crosses of the distant mirror, the nearer plane surface of the ruby, and the nearest mirror. The position of the ruby rod in the resonator with respect to its longitudinal axis was disregarded. In the second method, the cross of the distant mirror, seen through the active material, is superposed with the cross of the nearest mirror. Since the ruby crystals are nonuniform and these nonuniformities are responsible for different refraction indexes along the crystal diameter, it is difficult to superpose the crosses. The dependence of E_{thr} (the threshold pumping energy) on L (the distance between the mirrors of the interferometer minus the length of the ruby

Card 1/2

UDC: 535.89

ACC NR: AP6030723

rod) for the same ruby using both adjustment methods shows that with the second method the pumping threshold energy depends little on the distance. By changing the distance between the mirrors from 20 to 420 cm the pumping energy increased by only 56 joules. When the adjustment was done according to first method and the distance was changed from 20 to 360 cm, the threshold energy increased by 243 joules. In working with ruby lasers with external mirrors, the position of the ruby rod with respect to the mirrors is very important for the determination of the threshold values of the pumping energy. This is linked with the nonuniformity of the ruby crystal, which results in rays which are non-parallel with respect to the resonator mirrors. This can be compensated by using the first method of adjustment. Orig. art. has: 1 formula and 1 figure. [JA]
